SUMMARY

Senior Product Engineer with 6+ years in production React, TypeScript and Next.js, working from the interface down through the API, the data model and the deployment pipeline. Built and deployed Rivella on my own: a multi-tenant AI booking assistant running in production, where an agent holds a tool-calling conversation, retrieves from each tenant's knowledge base and writes real appointments into a third-party booking system. Built and published Prosvetum solo, an iOS book-summary app on the App Store with an AI mentor grounded in vector search. In commercial work, 2021 to 2026 at TeamArt: five years on EVCARGO's logistics and transport CRM, then the only frontend engineer on a restaurant CRM. Available immediately.

AI & PRODUCT ENGINEERING

Rivella — multi-tenant AI booking assistant rivella.app

Next.js · TypeScript · NestJS · Prisma · PostgreSQL 16 · Docker · GitHub Actions · Telegram Bot API · YClients API

- Built and deployed the product solo — a Next.js/TypeScript admin panel, a NestJS/Prisma API and PostgreSQL 16 — and run it in production on a VPS.
- The assistant runs a bounded agent loop over 15 tools, capped at 8 iterations and 120 seconds per turn with a per-call timeout, an output validator in front of every reply, and a per-conversation lock so a second message cannot start a second run.
- Retrieval is PostgreSQL full-text search over a knowledge base scoped to the tenant, with a keyword-scorer fallback — deliberately not a vector store, because the corpus is small, per-tenant and edited by hand.
- Designed a tenant-scoped data model with non-null tenant keys across all 12 tenant-scoped tables, one bot process per tenant behind per-slug webhook routing, and a separate superadmin authentication strategy with its own table.
- Integrated Telegram and YClients for availability, creation, rescheduling and cancellation — with a manager confirmation step and a fallback for the provider's booking race — plus five scheduled jobs for reminders, follow-ups, no-show detection, re-engagement and a daily digest.
- Ships continuously: GitHub Actions builds Docker images into GHCR and the VPS recreates the containers. 138 API tests pass across 12 suites, behind a 46-path OpenAPI spec.

Prosvetum — book-summary iOS app with an AI mentor App Store

React Native (Expo) · TypeScript · NativeWind · Supabase · pgvector · Sentry · EAS

- Built solo and published on the App Store in September 2026: book summaries with audio, quizzes, flashcards and an AI mentor.
- The mentor answers through a Supabase Edge Function, grounded in vector search over Voyage embeddings in pgvector; PostgreSQL with row-level security behind it.
- TanStack Query cache persisted to AsyncStorage; error monitoring in Sentry; builds and App Store submission through EAS.

EXPERIENCE

Frontend Developer Jan 2026 – Aug 2026

TeamArt — Multisoft · Remote

- Restaurant CRM for a Romanian HoReCa software vendor: the only frontend engineer on the project, building three separate apps for administrators, kitchen staff and waiters.
- Built all three apps in Next.js/TypeScript from scratch, designed and documented the component system, routing structure and frontend conventions, and implemented dense tables, filtering, validation and long forms over REST APIs.

Frontend Developer Feb 2021 – Dec 2025

TeamArt — EVCARGO · Remote

- Five years on a logistics and transport CRM for a UK logistics operator, web and mobile, delivering features end to end inside a cross-functional Scrum team.
- Built and maintained the shared design system and component library, then structured the client-side architecture around consistent UI and data patterns.
- Designed REST data flows with React Query and Axios, covering auth refresh, caching, pagination, filtering, invalidation and error handling.
- Contributed to the React Native app and cross-platform releases, and introduced Playwright coverage for critical user flows.
- Ran frontend code review and contributed to estimation, technical planning and release coordination.

Web Developer Aug 2019 – Dec 2020

Freelance · Remote

- Built and modernised client web applications in JavaScript and React, including legacy UI refactoring and end-to-end feature delivery.

SKILLS

Frontend: React, TypeScript, JavaScript, Next.js (App Router), React Native, Expo, HTML, CSS, Tailwind CSS, TanStack Query, Zod

Applied AI: Tool-calling agents, agent loop design, LLM integrations, prompt design, Anthropic / OpenAI SDKs, embeddings with pgvector, AI product UX

Backend & data: Node.js, NestJS, PostgreSQL, Prisma, Supabase, PostgreSQL full-text search, Docker, multi-tenancy, REST API design

Architecture & quality: Design systems, component libraries, auth flows, Playwright, Jest, CI/CD (GitHub Actions), EAS, Sentry, code review

EDUCATION

M.Sc. Information Technology — Technical University of Moldova 2018 – 2020

B.Sc. Information Technology — Technical University of Moldova 2015 – 2018
